CLAIMS

1	1. A method for dynamically patching code, comprising the steps of:										
2	intercepting program instructions;										
3	determining if a program instruction requires unavailable hardware										
4	functionality; and										
5	dynamically replacing the program instruction with a replacement instruction										
6	that does not require unavailable hardware functionality if it is determined that the										
7	program instruction requires unavailable hardware functionality.										
1	2. The method of claim 1, wherein the step of dynamically replacing the										
2	program instruction comprises fetching a replacement instruction and storing it in a										
3	code cache.										

- The method of claim 2, wherein the step of dynamically replacing the program instruction further comprises executing the replacement instruction in lieu of the program instruction each time a function associated with the program instruction is required.
- 1 4. The method of claim 3, wherein the replacement instruction comprises 2 part of a patch that is made available via an application programming interface.
- 5. The method of claim 1, further comprising the step of, prior to determining if a program instruction requires unavailable hardware functionality, determining if the program instruction has been cached.

- 1 6. The method of claim 5, further comprising the step of executing the
- 2 cached instruction in lieu of the program instruction if an associated instruction has
- 3 been cached.
- 7. The method of claim 1, further comprising the step of, prior to
- 2 intercepting program instructions, gaining control over execution of program
- instructions by injecting a dynamic execution layer interface into the program.
- 1 8. The method of claim 1, further comprising the step of dynamically
- 2 receiving information about unavailable hardware functionality and replacement
- instructions that are configured to replace original program instructions that require
- 4 the unavailable hardware functionality.
- 1 9. A system for dynamically patching code, comprising:
- 2 means for gaining control over execution of a program;
- means for intercepting program instructions;
- 4 means for determining if a program instruction requires unavailable hardware
- 5 functionality; and
- 6 means for dynamically replacing the program instruction with a replacement
- 7 instruction that does not require unavailable hardware functionality if it is determined
- 8 that the program instruction requires unavailable hardware functionality.
- 1 10. The system of claim 9, wherein the means for dynamically replacing
- 2 the program instruction comprise means for fetching a replacement instruction and
- 3 storing it in a code cache.

5

- 1 11. The system of claim 9, further comprising means for determining if a program instruction has been cached.
- 1 12. The system of claim 9, further comprising means for dynamically receiving information about unavailable hardware functionality and replacement instructions that are configured to replace original program instructions that require
- 4 the unavailable hardware functionality.
 - 13. A dynamic patching program stored on a computer-readable medium, comprising:
- logic configured to gain control over execution of a program;
- 4 logic configured to intercept program instructions;
 - logic configured to determine if a program instruction requires unavailable hardware functionality; and
- logic configured to dynamically replace the program instruction with a replacement instruction that does not require unavailable hardware functionality if it is determined that the program instruction requires unavailable hardware functionality.
- 1 14. The system of claim 13, wherein the logic configured to dynamically
 2 replace the program instruction comprises logic configured to fetch a replacement
 3 instruction and store it in a code cache.
- 1 15. The system of claim 13, further comprising logic configured to determine if a program instruction has been cached.

1	16. The system of claim 13, further comprising logic configured to
2	dynamically receive information about unavailable hardware functionality and
3	replacement instructions that are configured to replace original program instructions
1	that require the unavailable hardware functionality.

- A method for dynamically patching code, comprising the steps of: 17. 1 gaining control over the execution of a program; 2 intercepting program instructions; 3
 - determining whether the program instructions have been cached and, if so, executing the cached instructions;
 - if the program instructions have not been cached, determining if the program instructions require unavailable hardware functionality; and
 - dynamically replacing the program instructions with replacement instructions that do not require unavailable hardware functionality if it is determined that the program instructions require unavailable hardware functionality.
- The method of claim 17, wherein the step of dynamically replacing the 18. 1 program instructions comprises fetching replacement instructions and storing them in 2 a code cache. 3
- The method of claim 18, wherein the step of dynamically replacing the 19. program instructions further comprises executing the replacement instructions in lieu 2 of the program instructions each time a functionality associated with the program 3 instructions is required. 4

1	20.	The	method	d of	claim	19,	wherein	n the	replacement	instructions
2	comprise part	of a	patch	that i	is made	e ava	ailable v	via an	application	programming
3	interface.									

- 21. A dynamic execution layer interface (DELI) residing between an application and computing system hardware, comprising:
- a transparent mode layer that is configured to gain control over the operation of the application and to fetch replacement instructions that are to replace existing application instructions;
 - a system control and configuration layer configured to provide policies for the replacement of existing application instructions with the replacement instructions;
 - a core configured to dynamically cache and execute the replacement instructions; and
 - a code cache in which the replacement instructions are cached.
- 1 22. The DELI of claim 21, wherein the transparent mode layer is further 2 configured to fetch application instructions from the application and wherein the core 3 is further configured to cache fetched application instructions in the code cache.
